# Some history

Since 2004 Colciencias is realizing a program for the creation of centers of excellence in research. This initiative has been made possible by national resources and loans by international institutions. Following a strategic program, the following centers have been implemented till now:

- New materials
- Biotechnology
- Tropical diseases
- Environment
- Culture and institutions

# Why create a center on **complexity** in Colombia?

As complexity science develops, its focus is shifting from fundamental questions towards more specific and more applied problems, and its range extends towards ever larger and ever smaller scales, thus opening new opportunities for research and innovation in the field.

A host of problems specific to tropical developing countries require approaches based on complexity in order to be solved in a sustainable manner.

Studies in complexity are essentially theoretical in character and therefore easier to finance than any experimentally oriented research.

# Why create a center on complexity in **Colombia**?

There is an incipient community in Colombia working on complexity, with fresh enthusiasm but lacking a forum to bundle, coordinate, and concentrate these diverse efforts.

Colombia already has a leading position within the Andean and Caribbean regions in research and higher education and therefore suggests itself as a strategic site for a center with regional impact.

# How?

Some existing institutions that serve as **models** for our center:

- Santa Fe Institute (SFI), New Mexico, USA
- Max Planck Institute for the Physics of Complex Systems (MPIPKS), Dresden, Germany
- Brazilian Center for Research in Physics (CBPF), Rio de Janeiro, Brazil

However, our endeavor is **different** in some important aspects.

- Broad interdisciplinary spectrum of research subjects
- Dedication to problems specific for tropical regions / developing countries
- Emphasis on applications and consulting

# How?

In view of the large number of research groups and their broad thematic spectrum, the center will have a tree structure comprising three levels, the central level, five thematically defined domains -

**nanos**

natural and artificial nanosystems

**techne**

technology and industrial processes

**bios**

biological systems, ecosystems, and biologically-inspired systems

**gaia**

terrestrial, atmospheric, and oceanic processes in interaction with ecosystems

**oikos**

socio-economic systems

and the 25 individual research groups.

# Who?

The center will be operated as a joint venture of the following institutions (all in Bogota):

- 45% Universidad Nacional de Colombia (UNAL), public
- 45% Universidad de los Andes (UniAndes), private
- 5% Pontificia Universidad Javeriana (PUJ), confessional
- 5% Universidad del Rosario (URosario), confessional

Percentages refer to the number of participating groups as well as to the share in the budget.

# What?

The five-year budget of the center will amount to approximately:

- USD 1.7 millions from Colciencias
- USD 1.7 millions from participating institutions

It will be dedicated principally to:

- 50 % PhD / postdoctoral fellowships
- 15 % events (conferences, summer schools ...) and visitors program
- 15 % equipment and infrastructure
- 20 % administration and maintenance

## What is “nonlinear nanoscience”?

### Some constituent features:

- **Dynamical complexity**  
nonlinear dynamics, multistability, bifurcations, chaos, strange attractors, structural stability
- **Quantum effects**  
entanglement, nonlocality, tunneling, localization
- **Stochasticity**  
thermal fluctuations, Brownian motion, random forces
- **Many-body effects**  
decoherence, dissipation, energy-conversion cascades, collective modes
- **Non-equilibrium thermodynamics**  
directed transport, structure formation, energy and information flows, dynamical equilibrium, **life**

Submitted 9 December 2003; accepted in final form 26 February 2004

Cabrales, Pedro, Amy G. Tsai, John A. Frangos, Juan C. Briceño, and Marcos Intaglietta. Oxygen delivery and consumption in the microcirculation after extreme hemodilution with perfluorocarbons. *Am J Physiol Heart Circ Physiol* 287: H320–H330, 2004; 10.1152/ajpheart.01166.2003.—The oxygen transport capacity of fluorocarbons was investigated in the hamster chamber window model

fluorocarbons only become miscible with water when emulsified with phospholipids (derived from egg yolk) and therefore are not completely synthetic. Furthermore, whereas Hb carries oxygen via a reversible chemical reaction, fluorocarbons carry oxygen as a function of their solubility; therefore, at the  $PO_2$ s prevailing in the microcirculation in normoxic tissue oxygen
